

Google AI Studio Assignment (Oxford Edition)

Overview

This assignment guides you through building a production-ready Meeting Prep Assistant using Google AI Studio, Gemini models, Stitch, and optional Cloud Run deployment. You will demonstrate structured prompting, UX generation, version control, and deployment workflows.

Environment Setup

- Create or select a Google Cloud project.
- Enable billing (free tier sufficient).
- Enable Gemini API access in Google AI Studio.
- Select an appropriate Gemini model (e.g., Flash for speed, Pro for reasoning).
- Configure API key securely (if external integration required).
- Ensure GitHub account is ready for repository sync.
- Optional: Prepare Cloud Run for deployment.

Use Case: Meeting Prep Assistant

Design an application that prepares structured meeting intelligence. Inputs include a Notes PDF and presentation slides. Outputs must include meeting summary, risk identification, key talking points, next steps, and a cover image prompt.

Required Workflow

- Create a specialized Gem to generate structured meeting insights.
- Define output schema for summary, risks, talking points, and next steps.
- Generate UX screens using Stitch from structured descriptions.
- Export screens as PNG files.
- Import screens into Google AI Studio.
- Iterate and refine prompts with version history tracking.
- Demonstrate prompt diffs and reasoning improvements.
- Sync project to GitHub repository.
- Optionally deploy application to Cloud Run and test endpoint.

Prompt Engineering Expectations

- Use structured output formatting.
- Include reasoning constraints where necessary.
- Demonstrate at least 3 prompt iterations.
- Show evidence of refinement based on model behaviour.
- Avoid hallucinated facts and enforce grounding in provided documents.

Deliverables

- assignment.md explaining architecture and design decisions.
- Exported Stitch screens (PNG).
- AI Studio version history screenshots.
- Prompt iteration log.
- GitHub repository link.
- Optional Cloud Run URL.

Reflection (Max 800 Words)

- How did your prompt evolve across iterations?
- What model selection trade-offs did you observe?
- How did Stitch accelerate or constrain UX design?
- What would you change to productionise this system?

Completion Criteria

This assignment is marked Complete if all required components are submitted and functional. There is no grading scale. It is evaluated as Complete or Not Complete.
